Menu

- How much do we agree and disagree for malaria preventive measures: the example of India
- Reasons for 'disagreement' (?)
- Malaria summit
 - Universal malaria risk assessment (mapping)

We all agree on the malaria risk worldwide

We all agree on the dynamics of malaria risk

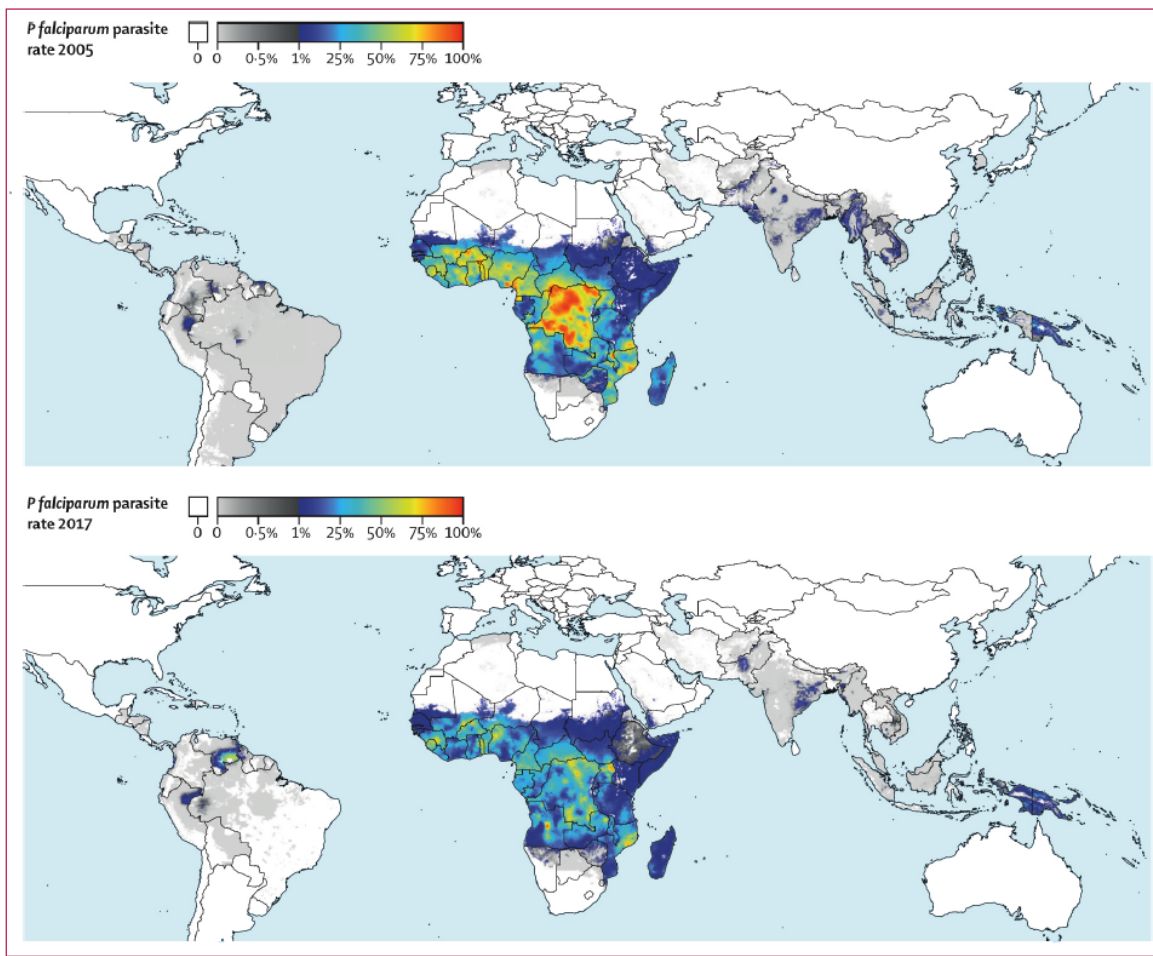

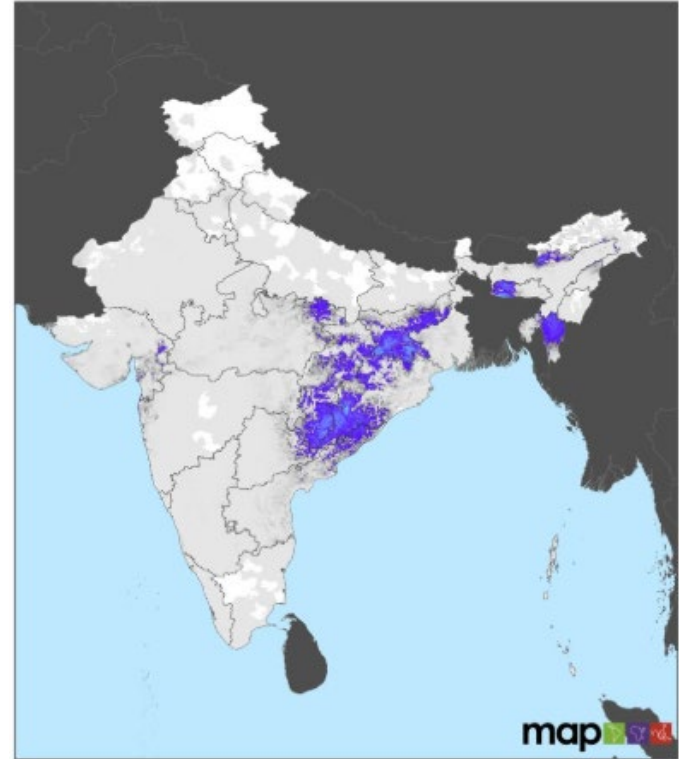

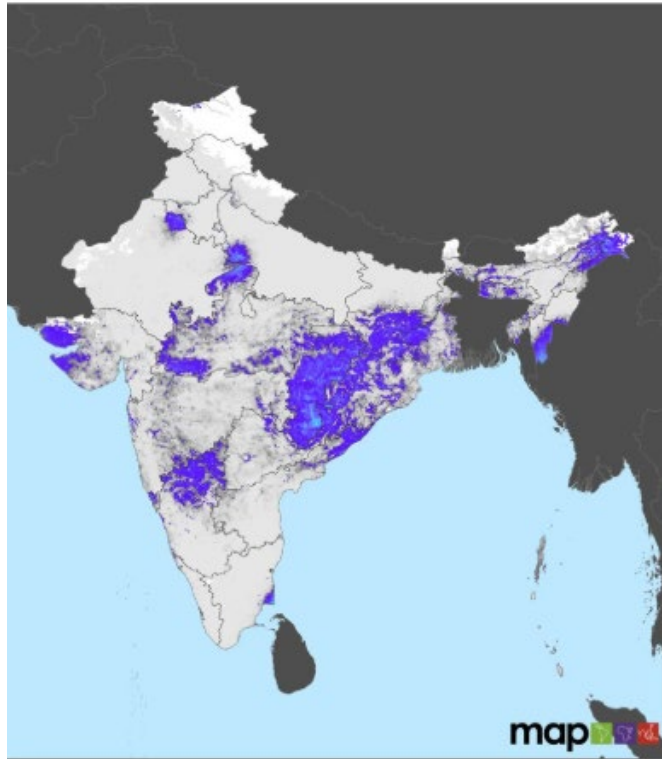

Figure 3: Spatial distribution of age-standardised *P falciparum* parasite rate₂₋₁₀ in 2005 (top) and 2017 (bottom)
Note the colour scaling is split to better differentiate within low endemic areas, with one linear scale between zero and 0.01 *P falciparum* parasite rate₂₋₁₀ (grey shades) and a second linear scale between 0.01 and 1 (colours from blue to red). Areas without endemic *P falciparum* are shown in white. *P falciparum* parasite rate₂₋₁₀=*P falciparum* parasite rate for children aged 2-10 years of age.

MAP Atlas *Pf* prevalence in India

2000

2017

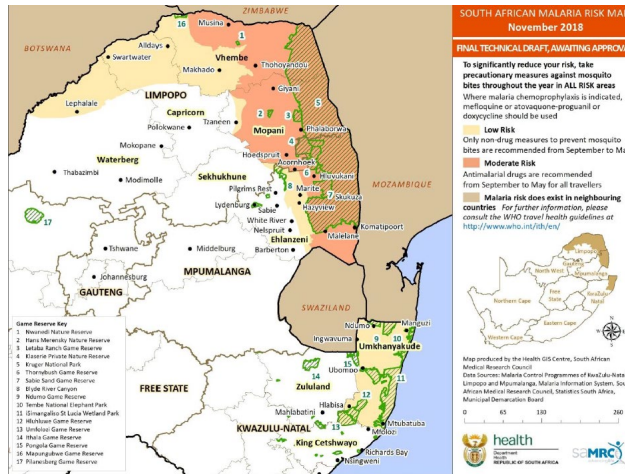

We all agree

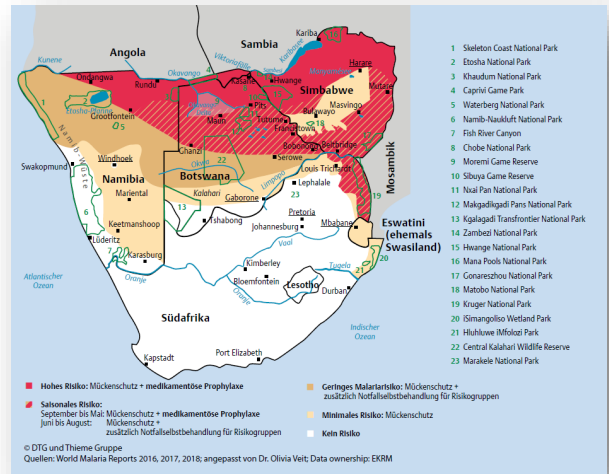

on the regional variations ?

NATHNAC

INDIA

Malaria Recommendations

There is a risk of malaria in the states of Assam and Orissa and in the districts of East Godavari, Srikakulam, Vishakhapatnam, and Vizianagaram in the state of Andhra Pradesh; and Balasor, Dindori, Mandla and Seoni in the state of Madhya Pradesh

Antimalarials recommended: atovaquone-proguanil or doxycycline or mefloquine

There is a low risk in other parts of India

Awareness and bite avoidance recommended

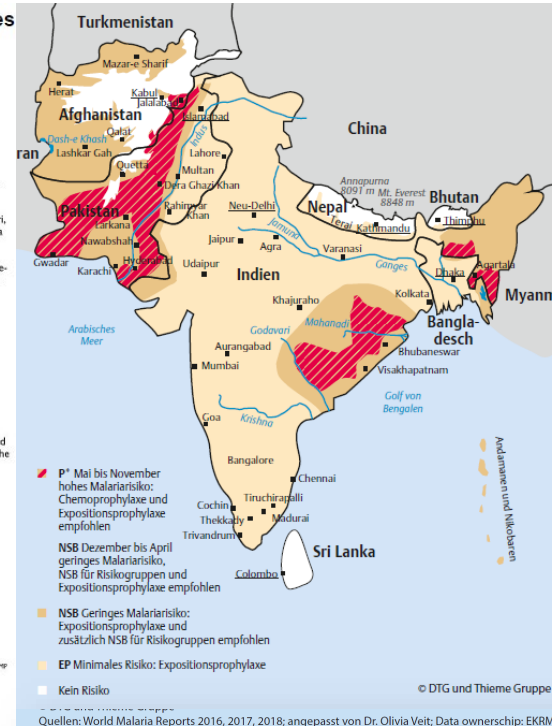

There is no risk in the Lakshadweep Islands

Other countries

This map is intended as a guide. It should be used with the recommendations in the risk section

Different national recommendations: why?

- Different malaria risk assessment?
- Different malaria recommendation development methodology?
- Different preventive measures available (availability of medication - licensure)
- Different 'culture'

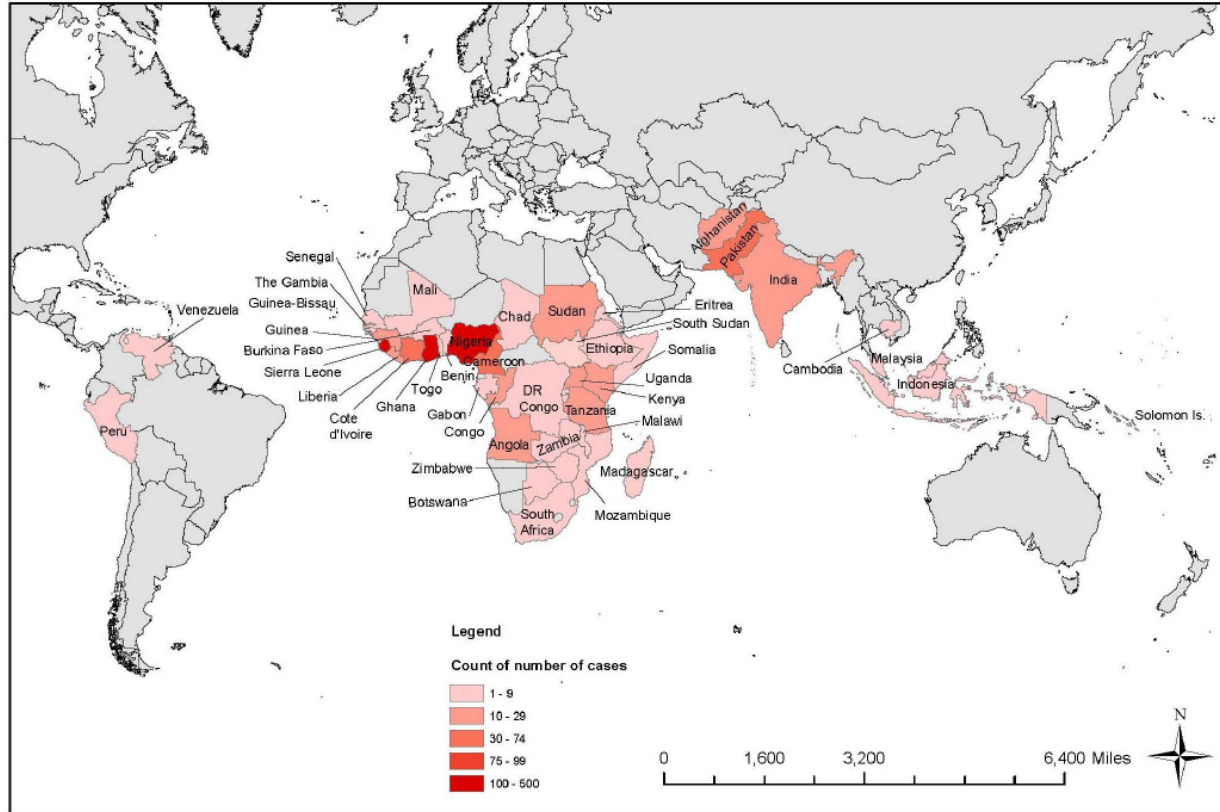

Different national recommendations: why?

- Different malaria risk assessment?
 - Imported malaria data vs local national statistics
- Different malaria recommendation development methodology?
- Different preventive measures available (availability of medication - licensure)
- Different 'culture'

Different national recommendations: why?

- Different malaria risk assessment?
 - Confusion
 - Malaria risk (rate) = number of cases/ 100'000 travelers
 - Malaria cases = absolute number of imported malaria cases from national statistics

Annual number of malaria cases: UK 2018

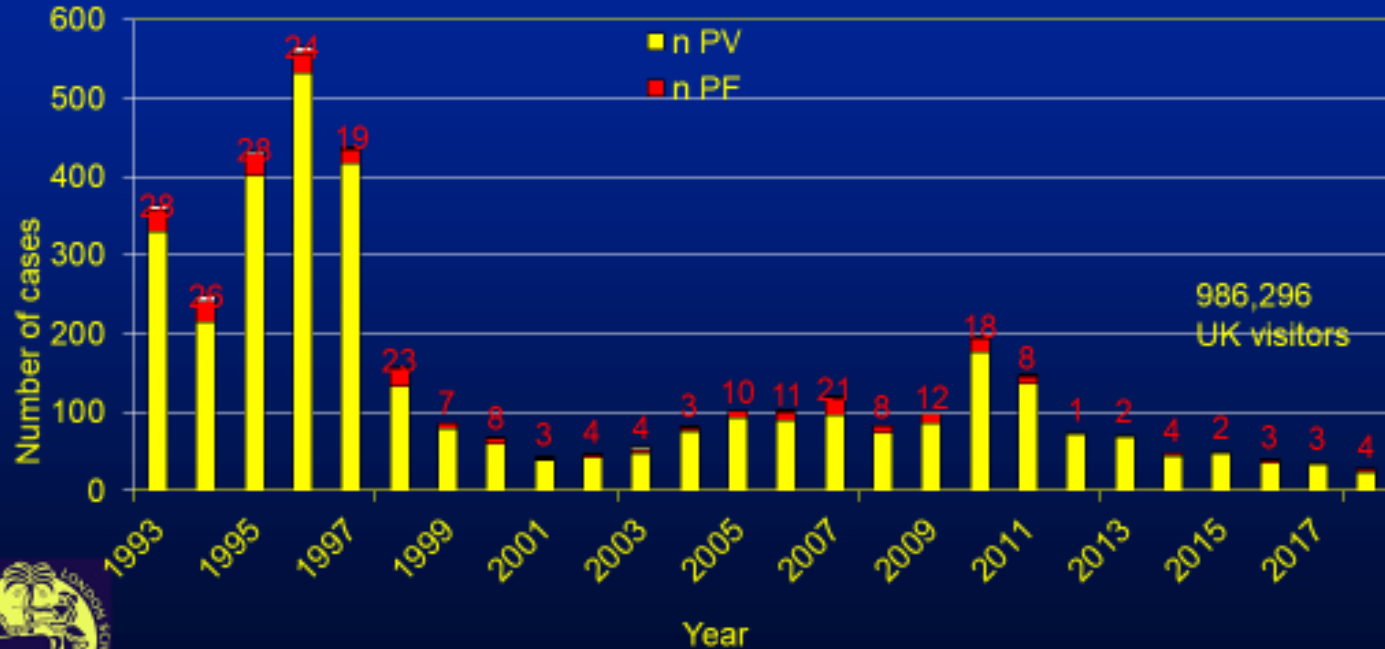

Different national recommendations: why?

- Different malaria risk assessment?
 - Imported malaria data: quality of evidence
 - Local national statistics
- Different malaria recommendation development methodology?
- Different preventive measures available (availability of medication - licensure)
- Different 'culture'

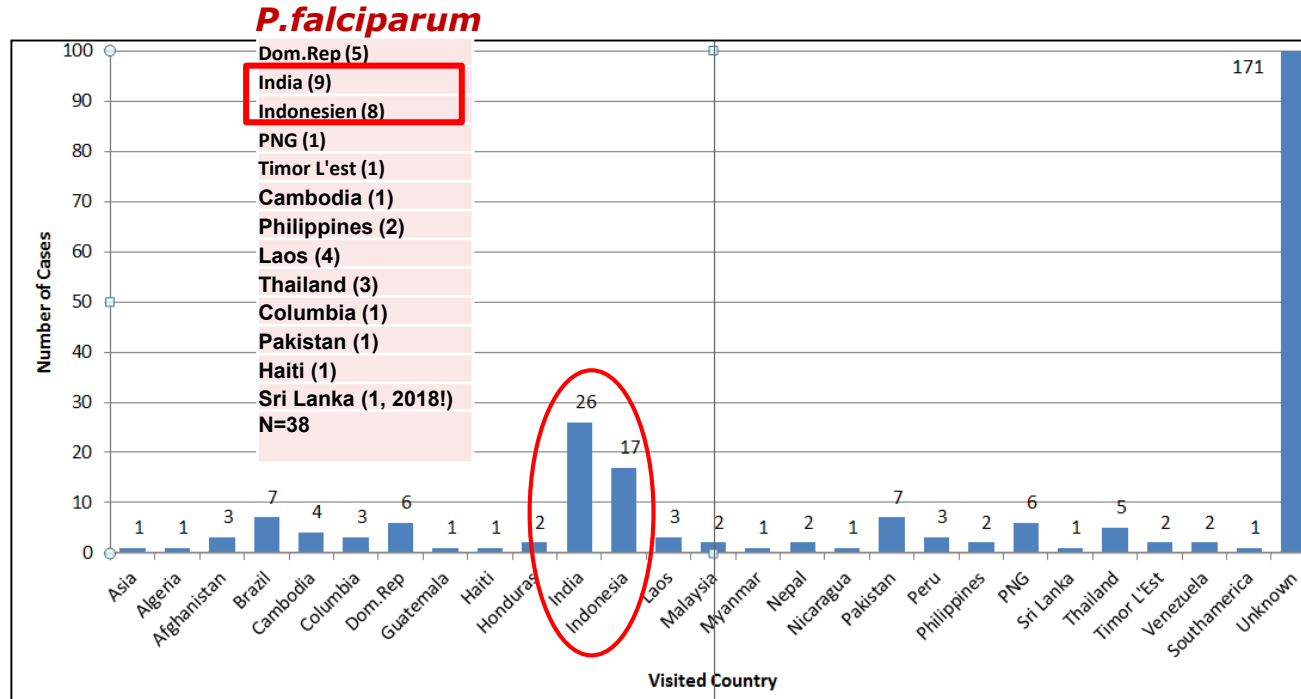

Malaria cases imported from INDIA

2019

Imported malaria cases to Switzerland from non-African countries, 2009-2018

Rate of all imported malaria in UK & USA residents (2004-11)

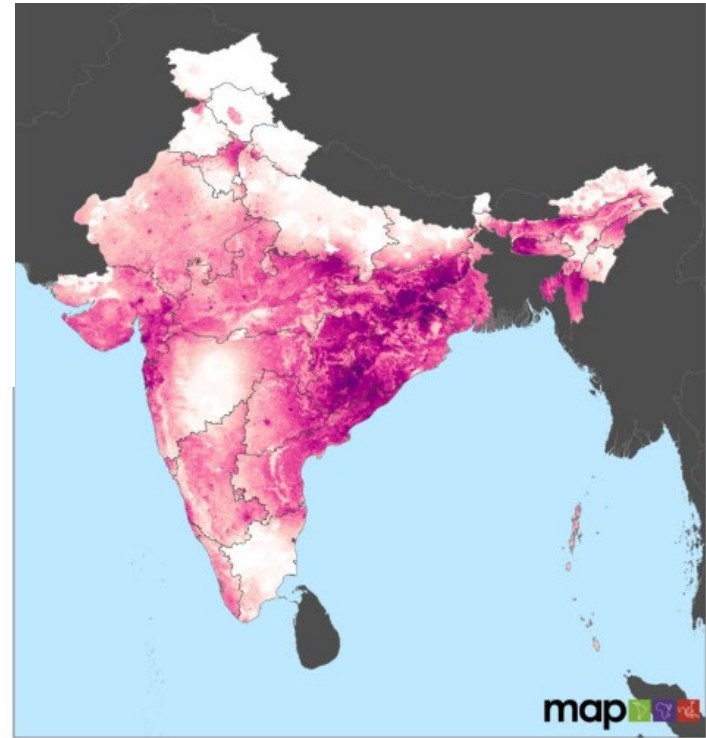

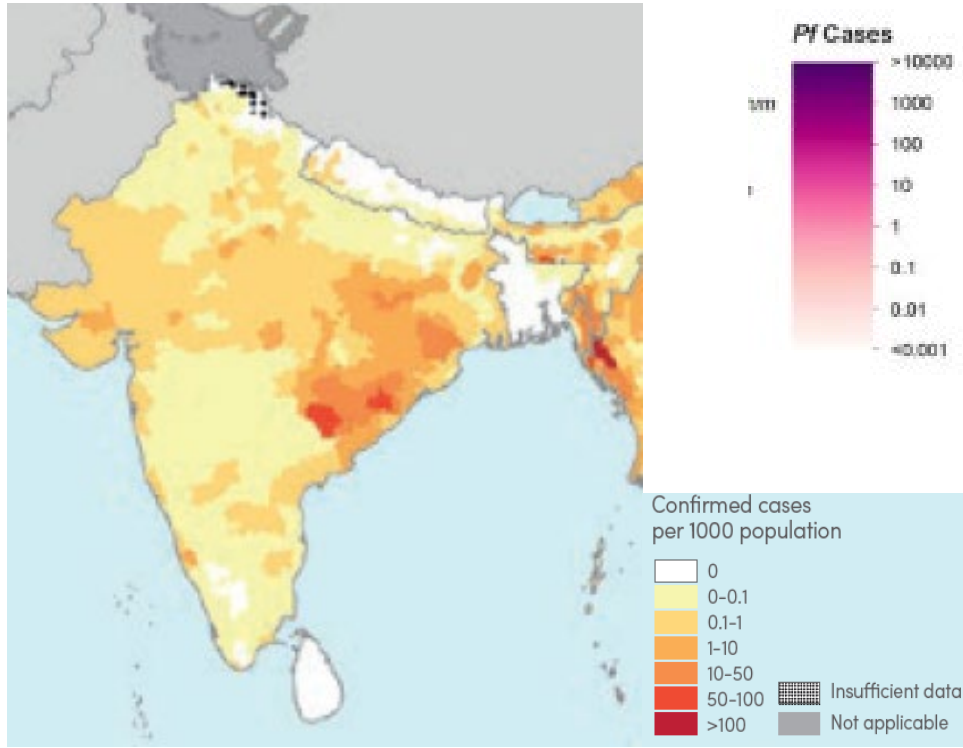

Courtesy from Ron Behrens

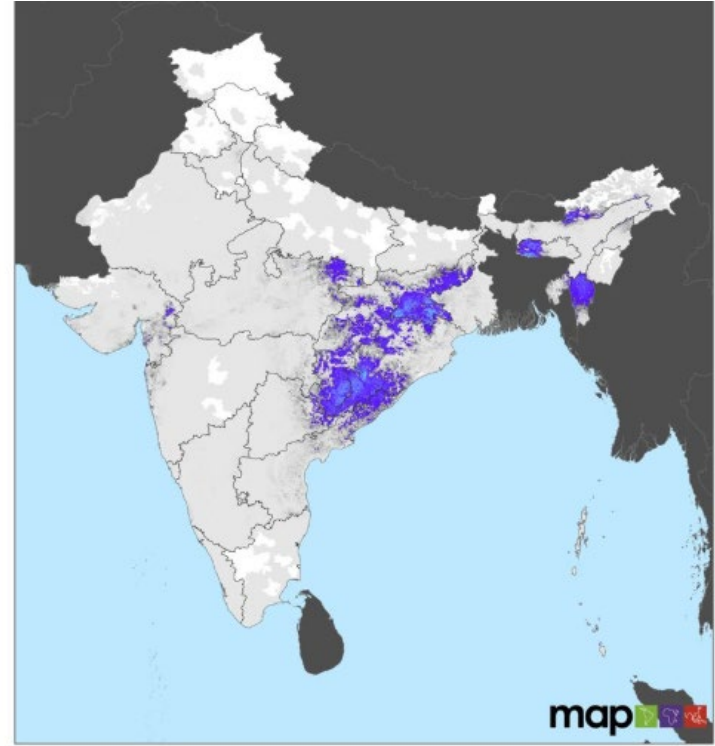

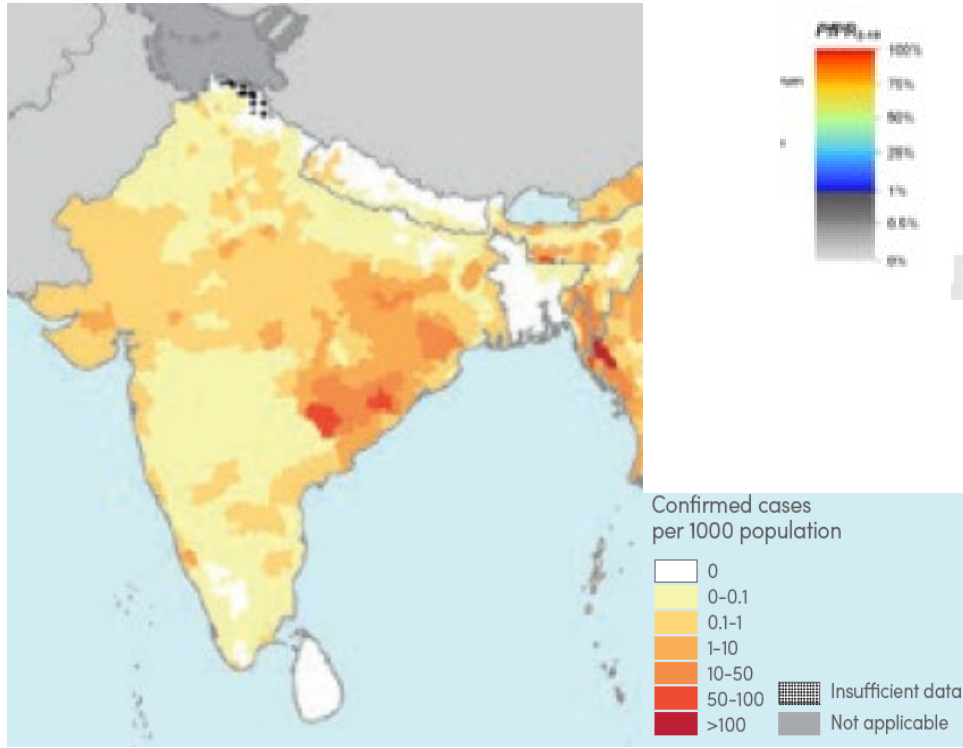

Different national recommendations: why?

- Different malaria risk assessment?
 - Imported malaria data
 - Local national statistics: quality of evidence
- Different malaria recommendation development methodology?
- Different preventive measures available (availability of medication - licensure)
- Different 'culture'

Local data: malaria *Pf* cases numbers

Local data: malaria *Pf* prevalence

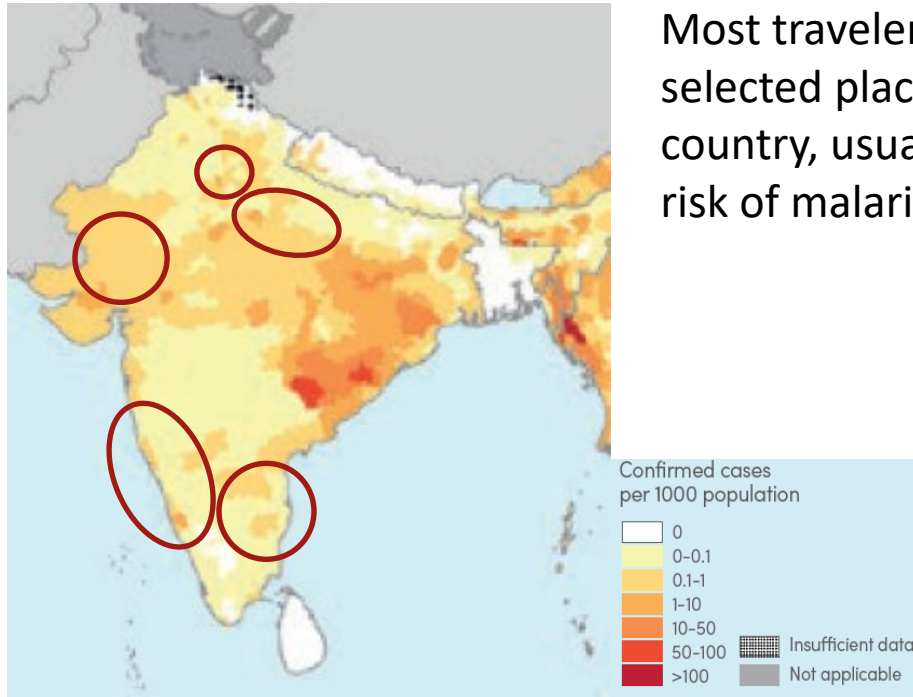

Reliance on local data: what's the problem?

Reliance on local data: what's the problem?

Most travelers go in selected places in the country, usually less at risk of malaria

Data sources vary in quantity and quality by country

- ❑ Mexico:
 - Weekly surveillance data of case counts by state published online
 - Cases by district available upon request via CDC-Mexico liaison
 - U.S. National Malaria Surveillance System (NMSS) data
 - Result: More detailed guidelines
- ❑ India:
 - World Malaria Report
 - Published literature
 - U.S. National Malaria Surveillance System (NMSS) data
 - Result: Less detailed guidelines, but align with WHO

Travelers data VS local data

Different national recommendations: why?

- Different ~~malaria risk assessment?~~
- Different malaria recommendation development methodology?
- Different preventive measures available (availability of medication - licensure)
- Different 'culture'

Different national recommendations: why?

- Different malaria risk according to country of citizenship?
- Different malaria recommendation development methodology?
- Different preventive measures available (availability of medication - licensure)
- Different 'culture'

CDC development and update of prophylaxis guidelines

Reassess

Gather

- Surveillance data (sub-national, U.S., other USG)
- Unpublished and confidential info
- Seminal papers and systematic reviews
- Entomology data
- World Malaria Report
- WHO and other national guidelines
- Personal communications (WHO, in-country contacts, etc.)

Assess

- Geographic spread of cases
- Trends
- Data quality
- Data quantity

Write

- Red pages
- Yellow Book
- Malaria notices

Adapted from K Tan, CDC

Imported Malaria Cases to Switzerland and Germany per 100 000 Travellers per Year

Example INDIA

COUNTRY	2009-2018	
	ARRIVALS (TOTAL)	ARRIVALS (average per year)
INDIA	0	
CH	463'926	46'39
D	2'463'159	246'31
A	338'232	33'82
TOTAL for CH/D/A	3'265'317	326'53

Arrivals in destination countries, based on UNWTO statistics of arrivals to countries by nationality

2009-2013

versus

2014-2018

ARRIVALS (average per year)	2009-2013						ARRIVALS (average per year)	2014-2018					
	Imported malaria cases (TOTAL)			Average per year of imported malaria cases (per 100 000 Travellers per year)				Imported malaria cases (TOTAL)			Average per year of imported malaria cases (per 100 000 Travellers per year)		
	Total	Pf/k/u	Pv/o/m	Total	Pf/k/u	Pv/o/m		Total	Pf/k/u	Pv/o/m	Total	Pf/k/u	Pv/o/m
0							0						
44'993	22	7	15	9.78	3.11	6.67	47'792	6	2	4	2.51	0.84	1.67
233'271	67	11	58	5.74	0.94	4.97	259'360	22	1	21	1.70	0.08	1.62
34'417	14	1	13	8.14	0.58	7.55	33'230	4	1	3	2.41	0.60	1.81
312'681	103	19	86	6.59	1.22	5.50	340'382	32	4	28	1.88	0.24	1.65

Pf/u= *Plasmodium falciparum/knowlesi*, unknown
 Pv/o/m= *Plasmodium vivax/ovale/malariae*

Different national recommendations: why?

- Different malaria risk according to country of citizenship?
- Different malaria recommendation development methodology?
- Different preventive measures available (availability of medication - licensure)
- Different 'culture'

Different national recommendations: why?

- Different malaria risk according to country of citizenship?
- Different malaria recommendation development methodology?
- Different preventive measures available (availability of medication - licensure)
- Different 'culture'

Availability of antimalarials for chemoprophylaxis

Product	Dosage	Schedule	Availability
Mefloquine	1 cp 250mg	1x/week	Everywhere
Atovaquone +proguanil	1cp 250/100mg	1x/d	
Doxycycline	1 cp 100mg	1x/d	
Primaquine	1 cp 15mg	2/d	US + endemic
Tafenoquine	1 cp 100mg	2/d x 3 days & 2/week	US, Brazil

Different national recommendations: why?

- Different malaria risk according to country of citizenship?
- Different malaria recommendation development methodology?
- Different preventive ~~measures~~ available (availability of medication - licensure)
- Different 'culture'

Different 'culture' between Europeans and Americans ?

- Risk perception?
 - Real fear of malaria, but why not of drugs...?
- Industry pressure?
- Legal consequences?
- Other?

Different 'culture' between Europeans and Americans ?

- Risk perception?
 - No systematic difference
- Attitudes towards risk?
 - Precaution principle in EU vs evidence of harm in US

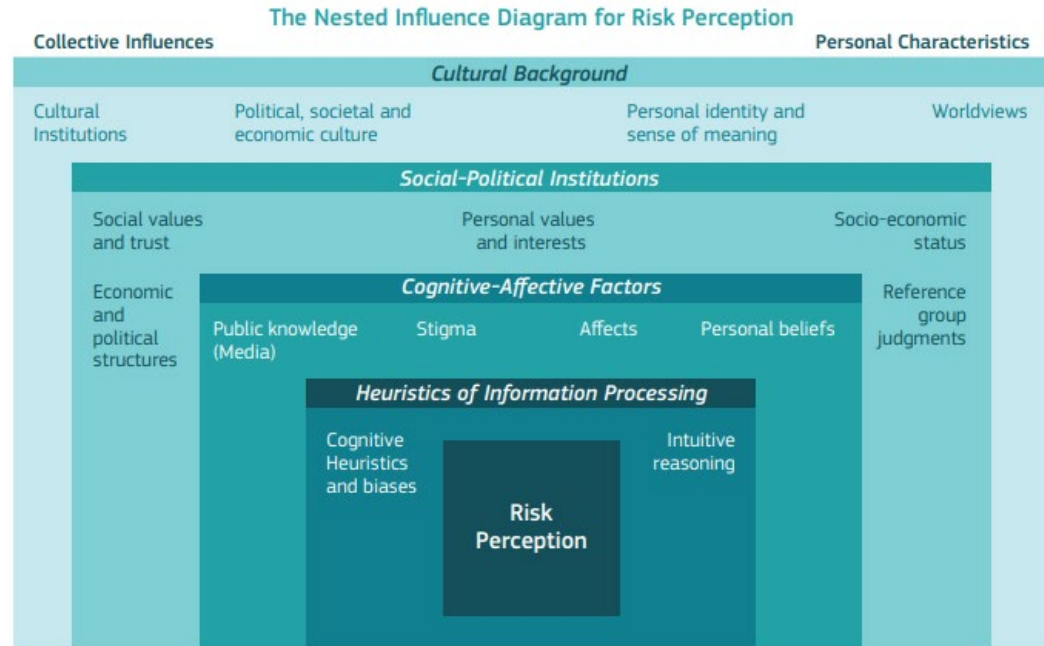

Figure 2. The multiple influences that interact to form risk perception (modified from Renn & Rohrman, 2000b).

Different 'culture' between Europeans and Americans ?

- Risk perception?
 - Real fear of malaria, but v
- **Industry pressure?**
- Legal consequences?
- Other?

The advertisement features a background image of a medical stethoscope and a document with text like 'SCORE RISK ASSES' and 'TOTAL SCORE'. The text is overlaid in white and yellow.

Chemoprophylaxis or SBET or nothing for travellers to India: a small calculation...

- In 2017: 17 millions foreign tourists arrivals in India
- 17 million x 50\$ = 850 millions \$
- Attack rate of *Pf* in 2017 (UK): 4/1'000'000
- 64 cases (4x17)
- 13.3 millions \$ per case of *Pf* malaria averted (850 millions/64)
- 1.8% CFR => ~1 death/year
- 850 millions \$ per *Pf* malaria death averted

Where do we go from there?

- Malaria summit organised by ISTM
(US, Canada, UK, CH, Holland, SA, Japan, Indonesia, Thailand, Brazil)
 - Compare recommendations
 - Compare guidelines development methodology
 - Share experience
 - Way forward

Malaria summit: main conclusions

- Everybody is doing pretty much the same in his/her own corner...
- Different level of granulation for risk assessment (~detailed local information)
- Need to combine work forces to get more accurate travelers data across countries
- Need to develop an accurate and dynamic malaria risk map using travelers data from several countries

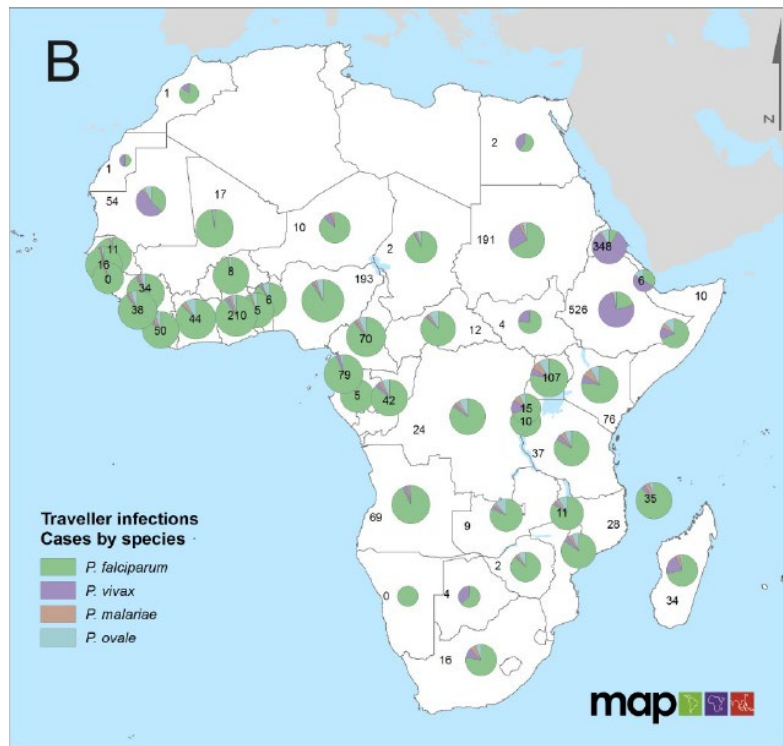

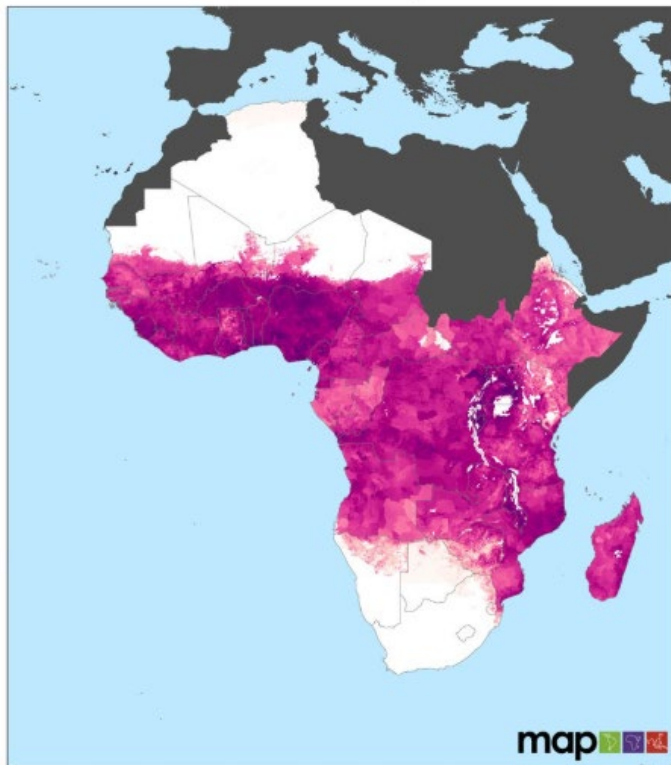

Malaria summit: main conclusions

- Collaborate with the MAP Atlas Project to develop a malaria risk map that takes into account **travelers and local data**

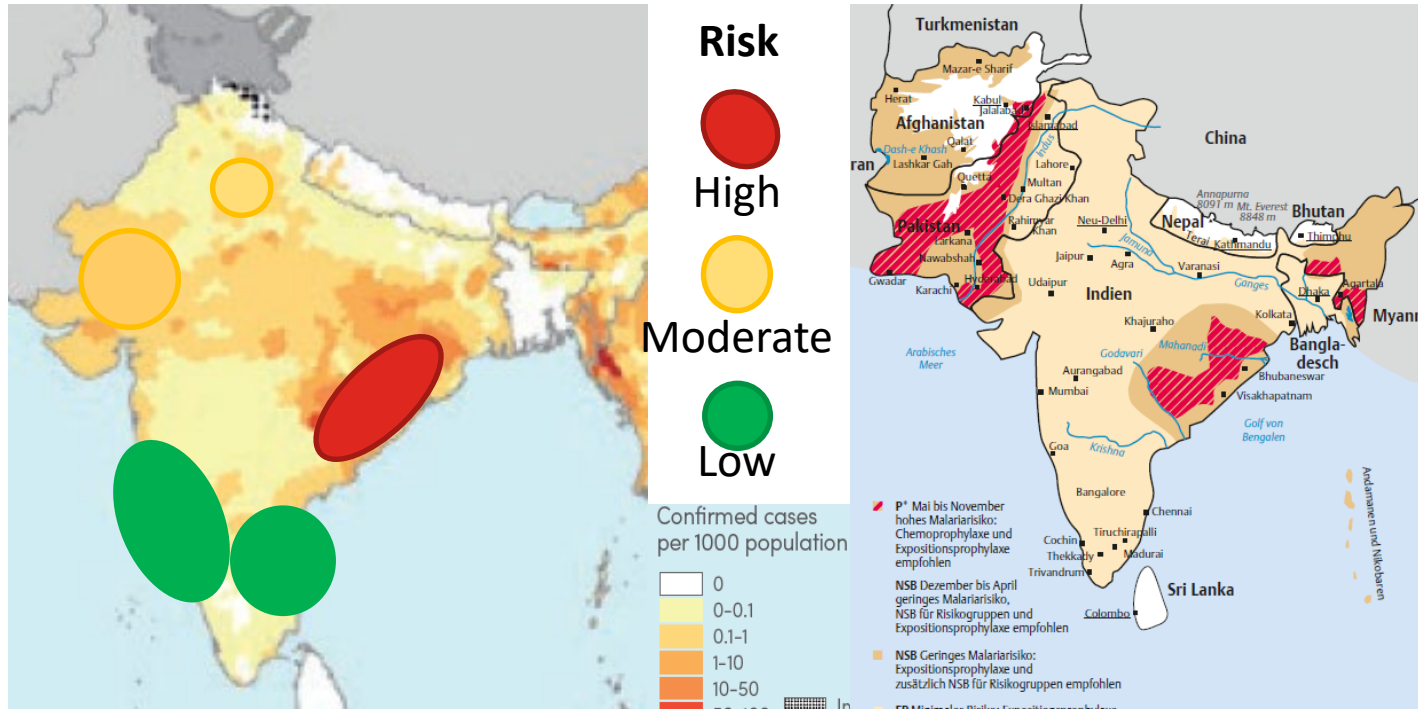

Malaria summit: main conclusions

The spatial distribution of *Plasmodium falciparum* malaria cases in 2017 in the WHO African Region

Malaria risk: integration of local and travellers data in a dynamic combined model that can be constantly updated

Way forward

- MAP researchers ready to embark
- National imported malaria data need to be collected on a standardised form
- Need to aggregate them, analyze and transfer them into a risk MAP
- Grading of risk => national recommendations + decision sharing with the traveler

Malaria: at risk groups

Increased risk of exposure

- Long-term travel
- VFR

+RDT

Increased risk of complications

- Pregnancy
- Aged person
- Co-morbidity (diabetes, C-V dis or immunosuppression)
- Young children

Consider prophylaxis or SBET (+RDT) or targeted preventive measures (decision sharing)
